EDUCATION

Indian Institute of Technology, Kharagpur July 2016 – May 2021
B.Tech & M.Tech (Dual Degree) in Mining Engineering & Safety Engineering,
Coursework: Artificial Intelligence: Foundations and Applications, Programming and Data Structures, Quantitative Decision Making

TECHNICAL SKILLS

Languages and Libraries: C#, Python, C++, Java, SQL, JavaScript, Rust, TensorFlow, PyTorch, Predacons
Technologies: Azure, Docker, Google vertex, Azure AI Studio, Function App, Kafka, DataBricks, Transformers

EXPERIENCE

Honeywell
Bengaluru, Karnataka

Advanced Software Development Engineer *July 2021 – Present*
Production Intelligence

- Worked on developing a large scale cloud native industrial software solution with robust, scalable and efficient architecture.
- Designed and developed application with 99.9% availability by using durable function and redundant workers.
- Designed and developed expression python evaluator using Azure function app for users to write calculations and execute formulas.
- Increased data back fill speed by 15x through parallelizing the code and bulk data insertion,
- Worked on azure infra, function apps, ARO, AKS, keda, Postgres SQL,file share, service bus, DataBricks, azure Studio.
- Worked on optimizing inter micro service call for reliability and speed using proper DNS Namespace and improving routing.
- Built tsdb apis on Druid to manage Time series data to efficiently read and write to it. without any insertion or retrieval latency,
- Used Durable function to run and orchestrate calculations on KPIs to provide timely results, insights and metrics to end users
- Delivered unique solutions to mining, manufacturing, chemical, environmental and other industries, with a tailor made approach
- Leveraged reason analysis and other advanced techniques to generate accurate predictions, aiding in quick decision-making

Honeywell Forge AI

- Accomplished the design and development of a RAG-based Agentic AI tool that effectively communicates across internal GET APIs, databases (sql, time-series), and logbooks, facilitating seamless data exchange and operational efficiency.
- Implemented an AI tool that answers queries through a user-friendly chat interface, improving the speed of information retrieval.
- Enhanced operational efficiency and user interaction by enabling smooth operations on KPIs and assets through agentic AI.
- Established Forge AI infrastructure by integrating Azure AI across Honeywell's ecosystem, enhancing the company's AI capabilities.
- Developed a GPT-4o based migration tool for legacy application calculations, eliminating manual migration efforts and Human errors.
- Migrated user code and configurations from VBScript to Python, transitioning configurations to the latest cloud infrastructure.
- Achieved savings of over 3000 days of manual work through automated migration with AI integration, accelerating project timelines.

Software Engineer Intern *June 2020 - August 2020*

- Successfully migrated Process Safety Analyzer code base from DotNet framework to DotNet core, achieving platform independence.
- Developed multiple Class Libraries, enhancing secure handling and analysis of SQL database from sensors Data and log files.
- Contributed to a pilot project, which led to Honeywell's decision to migrate entire Connected Industrial systems to the cloud.
- Ensured optimized performance and scalability, as measured by reduced processing time and improved reliability due to redundancy.

Quest Global
Thiruvananthapuram, Keral

Deep Learning Internship *May 2019 – July 2019*

- Developed monocular depth estimation to avoid collisions, utilizing an Encoder-Decoder trained on the KITTI dataset.
- Generated depth maps by integrating image and LIDAR data through a DenseNet201 based Encoder-Decoder model.
- Achieved object detection using SSD MobileNet V2, with deployment on NVIDIA TX1, ensuring 30ms response time and 15 FPS.
- Completed a 2-month intensive internship focused on enhancing depth estimation and object detection technologies.

Blueseed Ventures
December 2018

- Developed a backend and database management system using Node.js and MongoDB for web, Android, and iOS applications.
- Designed a user-friendly UX for a registration system, which enables the accurate estimation of power usage for landed properties.
- Successfully developed and implemented a community feed system using Google Firebase, designed for testing and enhancements.

PROJECTS

PREDACONS | Founder and Maintainer *October 2023 - Present*

- Established Predacons, a versatile Python library for simplified training and fine-tuning of large language models (LLMs).
- Developed user-friendly functions for seamless data handling and model training, enhancing usability and flexibility.
- Automated optimization to dynamically adjust fine-tuning, accommodating VRAM limits while allowing user-defined configurations.
- Created Predacons Server, an OpenAI-compatible web server, enabling effortless hosting of any LLM model.
- Introduced Predacons Agents, that enhance LLMs with data analysis, RAG, web scraping, decision-making, and code interpretation.
- Boosted output generation speed by up to 6x, significantly improving performance over standard methods.
- Integrated comprehensive features from data preprocessing to real-time chat generation, streamlining the NLP workflow.
- Lowered barriers to entry for complex NLP tasks, empowering developers, researchers, and enthusiasts to innovate and excel.
